                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MISCELLANEOUS: CELLS LACKING THE PROTEIN REQUIRE INCREASED LEVELS OF MG(2+) OR CA(2+) FOR GROWTH AND GERMINATION. APPROXIMATELY 50% OF CELLS WITHOUT THE PROTEIN CONTAIN ABNORMAL FTSZ RINGS, SUGGESTING IT IS INVOLVED IN SEPTUM SYNTHESIS; INCREASED LEVELS OF MG(2+) OR CA(2+) ONLY PARTIALLY ELIMINATE THE SEPTATION DEFECTS. SIMILARITY: Contains 1 fibronectin type III domain.

SIMILARITY: IN THE N-TERMINAL SECTION; BELONGS TO THE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PATHWAY: Peptidoglycan synthesis; final stages. SUBCELLULAR LOCATION: TYPE II MEMBRANE PROTEIN, OVER THE WHOLE CELL AT LOW CONCENTRATIONS. ALSO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       FUNCTION: CELL WALL FORMATION. SYNTHESIS OF CROSS-LINKED PEPTIDOGLYCAN FROM THE LIPID INTERMEDIATES. THE ENZYME HAS PENICILLIN-INSENSITIVE TRANSGLYCOSYLASE N-TERMINAL DOMAIN (FORMATION OF LINEAR GLYCAN STRANDS) AND A PENICILLIN-SENSITRANSPEPTIDASE C-TERMINAL DOMAIN (CROSS-LINKING OF THE PEPT SUBUNITS) (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PTM: THE PRODUCT EXPRESSED FROM THE TRANSLATION OF THE PONA APPEARS AS TWO BANDS ON A GEL (1A AND 1B), BUT THE SPECIFIC ACID SEQUENCE OF EACH PROTEIN IS UNKNOWN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DIVISION SITE IN VEGETATIVE CELLS.

                                                                                                                                                                                             DEVELOPMENTAL STAGE: In cerebral cortex, spinal cord and sciatic nerve levels are high early in development but decrease during postnatal development and are low in adults. In dorsal root ganglia levels remain high throughout development. INDUCTION: By nerve growth factor. INDUCTION: By nerve growth factor. OOMAIN: Has a highly basic region with many copies of the sequence KKEE and KKEI/V, repeated but not at fixed intervals, which is responsible for the binding of MAPIB to microtubules. FTM: IC1 is coexpressed with MAPIB. It is a polypeptide generated for the sequence of the sequence of the sequence of the sequence responsible for the binding of MAPIB to microtubules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    with MARIA and MAPIB proteins.
with MARIA and MAPIB proteins.
TISSUE SPECIFICITY: Nervous system (spinal cord, brain stem,
TISSUE, and arabrum). Not expressed in liver, spleen, kidney,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          stabilizing microtubules.
SUBUNIT: 3 different light chains, LC1,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Phosphory ated MAPIB may play a role in the cyroskeletal changes that accompany neurite extension. Possibly MAPIB Binds to at least two tubulin subunits in the polymer, and this bridging of subunits might be involved in nucleating microtubule polymerization and in
CAUTION: A C-terminal fragment of this protein (residues 1597 2459) was originally described as neuraxin in Ref.3.
                                                                SIMILARITY: TO MAPIA
                                                                                                                                         PTM: LC1 is coexpressed with MAP1B. It is a polypeptide generated from MAP1B by proteolytic processing. It is free to associate with both MAP1A and MAP1B. It interacts with the amino-terminal region

Nat. Struct. Biol. 6:847-853(1999).
-i- FUNCTION: MAY PLAY A KEY ROLE IN REGULATING THE RELATIVE AMOF CYCLIC AND NON-CYCLIC ELECTRON FLOW TO MEET THE DEMANDS (PLANT FOR ATP AND REDUCING POWER.
-i- CATALYTIC ACTIVITY: Reduced ferredoxin + NADP(+) = oxidized ferredoxin + NADPH.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    B B

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          HUMAN
                                                                                                                                                                                                                                                                                              SUBUNIT: 3 DIFFERENT LIGHT CHAINS, LC1, LC2 AND LC3, CAN ASSOCIATE WITH MAPLA AND MAPLE PROTEINS.

DOMAIN: Has a highly basic region with many copies of the sequence KKEE and KKEI/V, repeated but not at fixed intervals, which is responsible for the binding of MAPLE to microtubules.

PTM: LC1 is coexpressed with MAPLE It is a polypeptide generated from MAPLE by proteolyric processing. It is free to associate with both MAPLA and MAPLE. It interacts with the amino-terminal region
                                                                                                                                             s SWISS-PROT entry is copyright. "Ciprofloxacin resistance in coagulase-positive and -negative staphylococci: role of mutations at serine 84 in the DNA gyrase A protein of Staphylococcus aureus and Staphylococcus epidermidis.",

Antimicrob. Agents Chemother. 35:2151-2154(1991).

-i- FUNCTION: DNA GYRASE NEGATIVELY SUPERCOILS CLOSED CIRCULAR DOUBLE-STRANDED DNA IN AN ATP-DEPENDENT MANNER AND ALSO CATALYZES THE INTERCONVERSION OF OTHER TOPOLOGICAL ISOMERS OF DOUBLE-STRANDED DNA RINGS, INCLUDING CATENANES AND KNOTTED RINGS.

-i- CATALYTIC ACTIVITY: ATP-dependent breakage, passage and rejoining of double-stranded DNA.

-i- SUBUNIT: MADE UP OF TWO CHAINS. THE A CHAIN IS RESPONSIBLE FOR DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DNA gyrase subunit A (EC 5.99.1.3).
